Abstract for poster

GrInvIn is an open source program for the work with graphs and graph invariants – especially topological invariants from chemistry. In GrInvIn you can construct graphs, compute invariant values of these graphs and let the program make conjectures about the relation between invariants.

The main aim at the moment is to use GrInvIn in education on university level and even on high school level in order to foster mathematical reasoning. But there is also some development in order to make GrInvIn usable for research in graph theory and mathematical chemistry.

GrInvIn is Java-based and runs on any platform (Gnu-Linux, Mac and even Windows). It can be downloaded for free from <http://www.grinvin.org/>

During the poster presentation there will also be a demonstration of the program.
